

CIN628 Internet and Web Programming
Trimester 2 – 2013
Lab 1

Reference:

- HTML: <http://www.w3schools.com/>
- HTML5 and XHTML: <http://thenewboston.org/tutorials.php>

Part A: Building a Basic Web Page

1. Open a text editor.
2. Write the html tag
`<html>`
3. Write the head of your document
`<head>`
4. Write your title
`<title> Put your title here </title>`
5. Close the head of your document
`</head>`
6. Open the body of your document
`<body>`
7. Give your page a heading
`<h1> heading goes here </h1>`
8. Write your page contents
9. Separate paragraphs with the p tag
`<p>`
10. Close the body of your page
`</body>`
11. Close the html
`</html>`
12. Save the file as file.html
13. Open the file.html file in your Web browser.

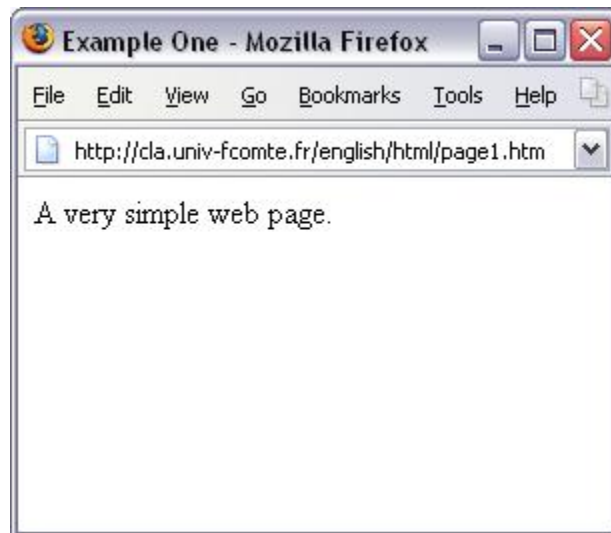

Tips:

1. Use any text editor to write your page.
2. Write your HTML tags in lowercase - this conforms to the current standard.

Source code for *A very simple web page*:

```
<html>
<head>
  <title>Example One</title>
</head>
<body>
  A very simple web page.
</body>
</html>
```

Here is *A very simple web page* in a browser:

**Part B: Building a Basic Web Page**

First, right-click on the picture of this cat below and save it to a folder on your computer so you can use it as an image on your web page. Then create a document in Notepad++ or any other editor using the example in the source document below. Minimum tag requirements are highlighted in bold, and further details are listed after the exercise.

When finished, save your source document with the **.html** file extension. Use quotes around the file name ("mypage.htm") to avoid saving it with the .txt extension. The document and the cat's picture must be in the same folder.

Source Document	Web Page
<pre><html> <head> <title> The Title </title> </head> <body> <h1>Welcome!</h1> <p> I will link to Yahoo </p> </body> </html></pre>	Welcome!  I will link to Yahoo

Required Tags in the Example

- The source document's text and codes go between the **<html>** opening tag and the **</html>** closing tag. An HTML source document contains two sections: Head and Body.
- The Head section (with the **<head>** and **</head>** tags) contains your title for the top of the browser. Type your title's name between the **<title>** and **</title>** tags.
- The contents of the Body section go between the **<body>** and **</body>** tags.

Other Tags in the Example

- Header text goes between the **<h1>** and **</h1>** tags. Largest to smallest levels are **<h1>** to **<h6>**.
- The image tag needs source, width, height and alt (description) attributes: ****. The image element and a few others do not have closing tags.

- `<p>` starts a paragraph, and `</p>` ends it.
- Text between `<b>` and `</b>` appears in bold type.
- `<a href="http://www.yahoo.com">Yahoo</a>` links this page to Yahoo.com. To link to a second page on your own site, use the attribute `href="page2.htm"`. The `a` tag stands for anchor. The word Yahoo between the anchor tag and its closing is set as a hyperlink.
- Audio and Video Files: To link this brief audio greeting, I typed `<a href="pcbill.mp3">Greeting</a>`. Video works the same way for wmv files. Please respect copyright laws.

Displaying a YouTube Video

Uploading a video to YouTube will allow their service to display the file on your web page. This is a good alternative to the slower process of initiating the video from your site. Many bloggers use services like [YouTube](#) and [Blip.tv](#) to embed videos on their blogs.

To display a video from YouTube, copy the Embed code next to the YouTube video, and paste it in your HTML source document. The video will work after you upload your page to your host's site.
