Database Design and Programming

Sem 1 2019

TRANSACTION MANAGEMENT & CONCURRENCY CONTROL

1.
 - (a) What is concurrent access?
 - (b) Give an example.
2. Consider the following transaction that reserves a seat on an airplane flight and changes the customer information:
 - Read customer information
 - Write reservation information
 - Write changes

Suppose that after the second step, the database crashes. Or for some reason, changes cannot be written.

What two things can be done to ignore or save the above transaction?

3. Explain what is **Lost Update**?
4. If transactions are executed in serial order, what two major implications could there be in terms **performance** and **transaction throughput**?
5. There are two different lock types to manage data.
 - (i) Name them.
 - (ii) Define both of them.
